

Roove – UAE Travel & Tourism Copilot

What is Roove?

Roove is an AI travel copilot for the UAE. A user tells us what they like, such as relaxed beaches, desert adventure, shopping, culture, family time or luxury, and Roove works out their travel style, suggests places that suit them, and builds a simple itinerary with travel visuals to go with it.

The flow is: **Preferences** → **travel style** → **suitable places** → **itinerary + travel visuals**.

Our data

We are not storing a large dataset. On first run, the app uses AI to generate its own data: a list of UAE places (Dubai, Abu Dhabi, Sharjah, Ras Al Khaimah, Fujairah and more) with a short description, category, vibe and best time to visit. We will also generate a few travel-style profiles and sample user preferences to test with. We also plan to use a handful of AI-generated or freely available travel images.

Text and embeddings. We turn each place description and the user's preferences into embeddings (lists of numbers that capture meaning). By comparing necessary details regarding the request we connect copilot and directly integrate it into the project.

Images. We will take travel images related to the UAE and use the encoder → latent space → decoder idea to compress and reconstruct them, using a simple autoencoder or VAE. We will then explain how VAE and GAN models could generate new destination visuals or mood images for each itinerary.
